

Pre Camping Checklist – The day before you go camping.

- Check the water level in your battery(s). Add only distilled water.
- Connect the negative cable to the battery.
- Check the charge level of the battery on the monitor panel.
- If necessary, plug the camper into an extension cord. Do not run the A/C while on the extension cord.
- Open both propane bottles and set the regulator to point to one of the bottles. Check the propane level. Set the regulator to point to the other bottle and check propane level in that one.
- Light all of the burners on your stove and let run for 30 seconds to bleed any air out of the line.
- Set the refrigerator to Gas and turn it on. It will try to light for 3 minutes. Check in 5 minutes to assure that the check light did not come on. If check light comes on, turn the fridge off for 1 minute and try again. Sometimes it can take up to 3 times to get the last of the air out of the lines. Do not start your fridge on Electric as it is very hard on the cooling unit.
- Put some water in your freshwater tank.
- Turn the pump on and check all of your faucets to assure good water flow.
- Turn off all faucets and listen for the pump. It should pressurize the system and then shut off. If the pump does not come back on, then you do not have any leaks.
- If this is the first trip this year, un-winterize your water heater. There are usually 1-3 valves located behind the water heater. The valves on the cold and hot water lines need to be in-line with these lines. The line that runs directly from cold to hot on the back of the tank is the bypass line. The valve on this line should be perpendicular (not in line)
- Fill the water heater by opening the hot water side of one of your faucets. It will “spit” for a few minutes and then run smooth. Turn off the faucet. Check that the water tank is full by opening – just crack a little – the pressure relief valve on the outside of the water heater. If water comes out, the tank is full.
- Start the water heater on Gas. Let it run for 20 minutes. After the 20 minutes is up, open the hot water side of a faucet and make sure you get hot water for a least a minute.
- Turn off the water heater and pump.
- Check the freezer on the refrigerator – the back of the freezer should now start getting cold.
- You should be good to go! Have a great trip, and call us if you have any questions!
